Instructions

[^ COLLAPSE ^](#)

Implement the Milestone 2 features from the project's proposal document:

<https://docs.google.com/document/d/1XE96a8DQ52Vp49XACBDTNCq0xYDt3kF29cO88EWVwfo/view>

Make sure you add your ucid/date as code comments where code changes are done All code changes should reach the Milestone2 branch Create a pull request from Milestone2 to dev and keep it open until you get the output PDF from this assignment. Gather the evidence of feature completion based on the below tasks. Once finished, get the output PDF and copy/move it to your repository folder on your local machine. Run the necessary git add, commit, and push steps to move it to GitHub Complete the pull request that was opened earlier Create and merge a pull request from dev to prod Upload the same output PDF to Canvas

table w fields for api, and req fields

Caption(s) (required) ✓Caption Hint: *Describe/highlight what's being shown***=, Task Response Prompt***Explain the columns and what data they represent (briefly), also note any normalization that may have been necessary*

Response:

ID is a unique value given to each row, user_id is given dependent on what the users ID is, linkedin username represents username on profile (linkedin), first_name represents profiles name from feild, headline is another api field scraped from linkedin, summary is the summary context from linkedin profiles (api), created timestamp, last modified timestamp, profile picture is the image url link, (150x150 profile picture on linkedin scraped from api), is manual (0 false, 1 true), is_favorite(0 false, 1 true).

End of Task 1

Task

Group: Define Appropriate Tables for Data

Task #2: Add the pull request link for the branch related to this feature

Weight: ~50%

Points: ~0.50

[^ COLLAPSE ^](#)

ⓘ Details:

Note: the link should end with /pull/#. Same pull request shouldn't be used for each feature.

2

1

The screenshot shows a 'Create LinkedIn Profile' form. It includes fields for LinkedIn Username ('john doe'), First Name ('John'), Last Name ('Doe'), Email Address ('john.doe@example.com'), Profile Picture (a placeholder image), and a Summary message area.

data creation page with working info

Caption(s) (required) ✓

Caption Hint: *Describe/highlight what's being shown*

Sub-Task

Group: Data Creation Page

Task #1: Screenshots of the creation page

Sub Task #2: Show how the API data is fetched for API data (must be server-side)

Task Screenshots

Gallery Style: 2 Columns

4

2

1

The screenshot shows a browser developer tools Network tab. An API call to 'store_profile.php' has been made, resulting in a 200 OK response. The status bar at the bottom indicates '0ms' and '0ms', suggesting a fast response time.

```

const formData = {
    username: "john",
    first_name: "John",
    last_name: "Doe",
    email: "john.doe@example.com",
    profile_picture: "https://i.pravatar.cc/300?img=1"
};

$.ajax({
    url: "/store_profile.php",
    type: "POST",
    data: formData,
    success: function(response) {
        console.log("Profile stored successfully!");
        console.log(response);
        profile_status = 2000;
        changeProfile();
    },
    error: function(error) {
        console.log("Error while storing profile");
        console.log(error);
        displayProfile(profile_error);
    }
});

```

Api fetching settings

Caption(s) (required) ✓

Caption Hint: *Describe/highlight what's being shown*

Task Response Prompt

Briefly explain the code

Response:

The API call is being made using jQuery's `$.ajax()` method in the browser. After receiving the data, it's then sent to `store_profile.php` to be saved in the database

Sub-Task

Group: Data Creation Page

Task #1: Screenshots of the creation page

Sub Task #3: Show examples of validation messages

Task Screenshots

Gallery Style: 2 Columns

```

4 2 1

The screenshot shows a code editor with several lines of JavaScript or similar script. The code includes conditional statements and function definitions related to validation logic.

```

client side validation

Caption(s) (required) ✓

properly stored and shows validation message

Caption(s) (required) ✓

Caption Hint: *Describe/highlight what's being shown*

Sub-Task

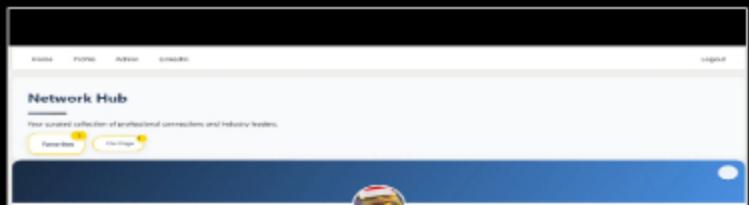

Group: Data Creation Page

Task #1: Screenshots of the creation page

Sub Task #5: Design/Style should be considered (i.e., bootstrap, custom css, etc)

Task Screenshots

Gallery Style: 2 Columns

The screenshot shows a user profile for 'Julian Chee'. At the top, there's a navigation bar with 'Edit Profile' and 'Logout' buttons. Below the header, there's a bio section with a 'Read More' button. The main content area displays a profile picture, name ('Julian Chee'), location ('San Francisco, CA'), headline ('Software Engineer'), summary ('I am a software engineer with a passion for building efficient and user-friendly applications. I have experience in Java, Python, and C++ and am always looking for opportunities to learn and grow.'), and a 'Profile Picture' link.

shows off custom css using bootstrap framework

Caption(s) (required) ✓

Caption Hint: *Describe/highlight what's being shown*

Task Response Prompt

Briefly explain your design choices

Response:

I wanted the theme to look similar to linkedin considering thats the information the user is going to be handling in this webpage, I wanted it to be clear and easy to view and I wanted there to be nice animations and effects scattered across which there are many subtle effects.

End of Task 1

    // LinkedIn username validation
    const username = form.linkedin_username.value;
    if (username.match(/^(?=[a-zA-Z0-9]{3,100}$)(?!.*\s).*/)) {
        flash("LinkedIn username must be 3-100 characters and contain only letters, numbers, and hyphens");
        invalid = false;
    }

    // Name validation
    if (form.first_name.value.trim().length === 0) {
        flash("First name is required");
        invalid = false;
    }
    if (form.last_name.value.trim().length === 0) {
        flash("Last name is required");
        invalid = false;
    }

    // URL validation (if provided)
    const pictureurl = form.profile_picture.value;
    if (pictureurl != undefined || pictureurl != '') {
        flash("Please enter a valid URL for the profile picture");
        invalid = false;
    }
}

return invalid;
```

JS validation

Caption(s) (required) ✓

Caption Hint: *Describe/highlight what's being shown*

Task Response Prompt

Briefly explain the validations

Response:

JS - Validates LinkedIn username format (letters, numbers, hyphens, 3-100 chars). Looks for empty required fields

PHP - Checks for empty required fields. Checks if user input is valid for each field (empty, length, etc.)

(first name, last name), Validates profile picture URL if provided, Returns false to prevent form submission if any validation fails.

PHP- Validates required fields (username, first/last name). Checks LinkedIn username format with regex. Uses validateProfilePictureUrl() function for URL validation. Sets \$hasError flag if any validation fails.

Sub-Task

Group: Data Creation Page

Task #2: Screenshots of creation page code

Sub Task #3: Successful creation should have a user-friendly message

```
try {
    $stmt->execute([
        ':uid' => get_user_id(),
        ':username' => $username,
        ':fname' => $firstName,
        ':lname' => $lastName,
        ':headline' => se($_POST, "headline", "", false),
        ':summary' => se($_POST, "summary", "", false),
        ':picture' => se($_POST, "profile_picture", "", false)
    ]); // #73-81 $stmt->execute
}
```

local create feature

Caption(s) (required) ✓

Caption Hint: *Describe/highlight what's being shown*

≡, Task Response Prompt

Briefly explain the steps (include how duplicates are handled)

Response:

Locally creates user filled data into db fields, does not need to fetch api for locally created data

Sub-Task

Group: Data Creation Page

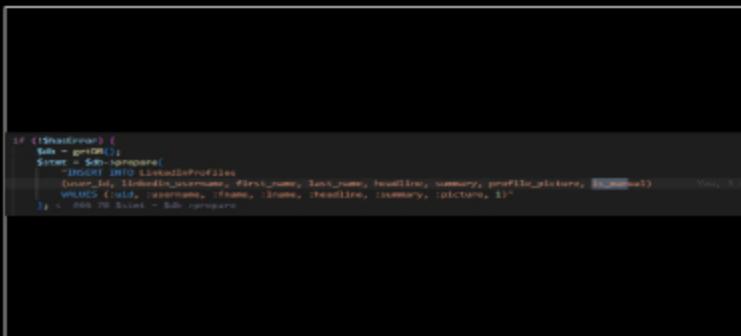

100%

Task #2: Screenshots of creation page code
 Sub Task #6: Include some indicator between custom data and API data

Task Screenshots

Gallery Style: 2 Columns

4 2 1

```
if (!is_logged_in()) {
    $stmt = $db->prepare("INSERT INTO LinkedinProfiles (id, username, name, bio, headline, summary, profile_picture, is_manual) VALUES (:id, :username, :name, :bio, :headline, :summary, :picture, 1)");
    $stmt->execute(['id' => $id, 'username' => $username, 'name' => $name, 'bio' => $bio, 'headline' => $headline, 'summary' => $summary, 'picture' => $picture]);
}
```

is_manual indicator

Caption(s) (required) ✓

Caption Hint: *Describe/highlight what's being shown*

Task Response Prompt

Briefly mention what the indicator is (i.e., api_id if the API has ids or is_api as a boolean-like column, etc)

Response:

boolean column checks if the profile was created by inputed values, is_manual == 1 (true) else, data takes the value 0 (indicating the data must have been fetched from api)

Sub-Task

Group: Data Creation Page

100%

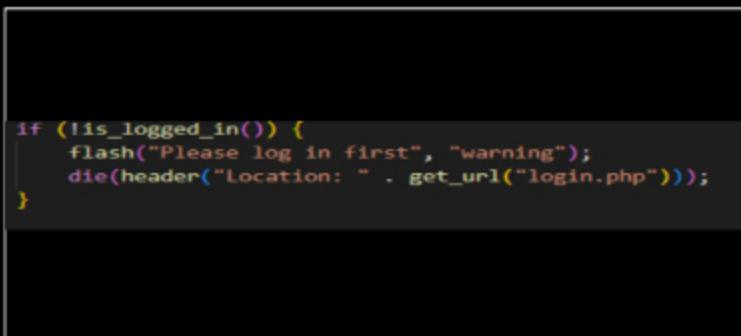

Task #2: Screenshots of creation page code

Sub Task #7: Include any other rules like role guards and login checks

Task Screenshots

Gallery Style: 2 Columns

4 2 1

```
if (!is_logged_in()) {
    flash("Please log in first", "warning");
    die(header("Location: " . get_url("login.php")));
}
```

login check

Caption(s) (required) ✓

Caption Hint: *Describe/highlight what's being shown*

Task Response Prompt

Briefly explain the logic/reasoning

Response:

login check, ensures a user is logged in for proper user mapping. No roles needed as any user at any permission can create custom profiles, which will be isolated to there account using their user_id

        url.searchParams.set("page", '1'); // Reset to first page on filter change
        window.location.href = url.toString();
    }
}

```

What handles and regenerates the page depending on selected filters

Caption(s) (required) ✓

Caption Hint: *Describe/highlight what's being shown*

≡, Task Response Prompt

Briefly explain the related logic

Response:

The function manages two main tasks: handling pagination (letting users choose how many profiles to show per page, either through preset options or a custom number) and filtering (allowing users to view specific types of profiles). When either option changes, it updates the URL and refreshes the page to show the desired results.

detailed view link sends user to

Caption(s) (required) ✓

Caption Hint: *Describe/highlight what's being shown*

=, Task Response Prompt

Briefly explain the details shown and how it differs from the list view

Response:

list view and details view are combine in this instance the full amount of information is presented on each users card, in the case if I were to use more data fields being fetch from the api that could work, however already there is a large amount of potential data for each user given the summary alone. I think the design idea of this project is to specificaly reduce the over-bearing amount of information linkedin pushes onto its user (as linkedin is a social media platform for one) there is alot of content people can get dragged into when another larger portion of what linkedin is for is networking and job hunting, that is what I want to target.

// More code here
```

Caption(s) (required) ✓Caption Hint: *Describe/highlight what's being shown***Task Response Prompt***Provide a high-level step-by-step of how the fetching of the record, populating the form, and the update works and gets changed in your DB*

Response:

The edit profile process begins with a security check, making sure only Admin users can access the page and validating that a proper profile ID was used. Once these checks pass, the system fetches the existing profile data from the LinkedInProfiles database table using the provided ID. The fetched profile data is then used to populate a form, displaying the current values for fields like LinkedIn username, first name, last name, headline, and summary. Users can see and modify the existing information directly in the form fields. When the form is submitted, the system captures all the updated values from the POST request and runs them through validation checks. These checks ensure required fields like LinkedIn username, first name, and last name aren't empty. If all validation passes, the system prepares and executes an SQL UPDATE statement to modify the profile record in the database. The statement updates all fields with their new values for the specific profile ID. Upon successful update, the user receives a success message and is redirected back to the profiles list page. If any errors occur during this process, appropriate error messages are displayed and logged.

Task Response Prompt

Explain in concise steps how this logically works

Response:

This JavaScript function handles the deletion of a profile when called, it shows a confirmation popup asking the user if they're sure about deleting the profile. If the user confirms, the function creates a hidden HTML form dynamically in the page. This form is built with two hidden input fields: one containing the profile ID to be deleted, and another indicating this is a delete action. Once the form is constructed with these hidden fields, it's temporarily added to the webpage and automatically submitted. This makes sure the deletion request is sent as a POST request rather than a GET request.

Sub-Task

Group: Delete Handling

Task #1: Screenshots related to delete

Sub Task #4: Explain the delete logic

100%

Task Response Prompt

Is it a soft or hard delete? Are there any necessary roles or restrictions? (can only delete their data, can only be done by admin, etc)?

Response:

The delete feature is a hard delete, it completely removes the row from the table on delete. The only restriction is the user needs to be logged in with someone with a role admin, and the field being deleted needs to exist.

📝 Task Response Prompt

Response:

I was able to implement most features, but given the context of the api im accessing and the data I am fetching it didnt make sense to do certain things such as the detailed list view. But In exchnage for this I made sure the other feature I made were polished and worked well, aswell as add other things.
